

Kubernetes QCM – Beginner to Master

BEGINNER LEVEL

1. What is Kubernetes mainly used for? (B) Managing containers at scale
2. What is the smallest deployable unit in Kubernetes? (C) Pod
3. Which command lists all pods? (C) `kubectl get pods`
4. Which component schedules Pods? (C) kube-scheduler
5. What does a Node represent? (C) A machine running workloads

INTERMEDIATE LEVEL

6. Role of a Service? (B) Expose Pods and stable networking
7. Service type for external exposure? (C) LoadBalancer
8. What happens if a Pod crashes? (B) Kubernetes recreates it
9. Ensures pod replicas? (C) ReplicaSet
10. Namespace purpose? (B) Resource isolation

ADVANCED LEVEL

11. What is etcd? (B) Cluster key-value store
12. Best for stateless apps? (C) Deployment
13. ConfigMap used for? (B) Configuration
14. DaemonSet ensures? (B) One Pod per Node
15. Declarative command? (C) `kubectl apply`

EXPERT LEVEL

16. RBAC purpose? (B) Authorization
17. Service networking handled by? (C) kube-proxy
18. Liveness probe? (B) Restart unhealthy containers
19. Scheduling depends on? (C) Requests & Limits
20. StatefulSet vs Deployment? (C) Persistent identity
